

****Call Transcript: Adding FTP Data Source for [redacted]****

****Date:** June 2, 2025**

****Participants:****

- ****Priya Sharma**** (Project Manager, PM)
- ****Liam Chen**** (Solutions Architect, SA)
- ****Emma Rodriguez**** (UX Lead, UX)

****[14:02:31]** **Priya (PM):**** Hey, everyone, thanks for joining! Uh, sorry, my coffee machine's being loud back there. We're here to talk about adding an FTP data source for [redacted] on CodeMie. They need to pull data from their legacy systems. Liam, can you... kick things off with the technical setup?

****[14:02:48]** **Liam (SA):**** Sure thing. So, uh, for the FTP connection, [redacted] will provide their server details—hostname, port, username, and password. I'm thinking we use SFTP to keep the data transfer secure. We'll connect to their server and pull the files. Oh, Priya, quick check—did they say if they're using plain FTP or...?

****[14:03:12]** **Priya (PM):**** Good point. I don't think they specified. Let's assume SFTP for now, and I'll confirm with their IT team. Keep going.

****[14:03:20]** **Liam (SA):**** Alright. So, we'll use their credentials to authenticate and fetch the files. For security, we'll store the credentials in our encrypted vault with role-based access control. I'd also recommend IP whitelisting to restrict connections to their server. They're expecting about 500 GB of data initially, then 2–3 GB daily. We'll need to know their file formats—CSV, JSON, or something else—to process them correctly. Any questions?

****[14:04:05]** **Emma (UX):**** That sounds good, Liam. I'm just... thinking about how [redacted]'s team will configure this in the UI. We should add an "FTP Data Source" option to the setup wizard, with fields for hostname, port, username, password, and directory path. Uh, should we make the port optional, defaulting to 22 for SFTP? And—sorry, Liam—what about setting how often we pull new files?

****[14:04:32]** **Liam (SA):**** Yeah, polling's important. Defaulting the port to 22 is fine, that's standard for SFTP. For polling, maybe every 15 minutes? But we could let users set it anywhere from 5 minutes to 24 hours. Also, we should validate credentials when they're entered to avoid mistakes. Emma, will they need to specify file patterns, like only pulling "*.csv" files?

****[14:04:55]** **Emma (UX):**** Hmm, yeah, a file pattern field would help. I'd make it optional, defaulting to all files in the directory. A "Test Connection" button would be nice too, so they can verify the setup before saving. I'm picturing a clean form with tooltips for each

field and a link to our docs for advanced FTP options. Priya, uh, how's this looking for the team's schedule?

[14:05:22] **Priya (PM):** *laughs* Well, that's the tricky bit, isn't it? The dev team's swamped with two other projects due by Q3. This FTP feature's a priority for [redacted], but... I'm estimating 3-4 sprints, so 6-8 weeks, with two devs and a QA engineer. Emma, can your team get the UI designs done in the first sprint, like early July?

[14:05:48] **Emma (UX):** Should be doable. I'll need a week to mock up the form and get feedback. Liam, if you can confirm the file formats by next Wednesday, we'll stay on track. That cool?

[14:06:02] **Liam (SA):** Yeah, works for me. The connection setup's straightforward, but we need to plan for that 500 GB initial pull. It'll take some testing to make sure we can handle it. Priya, can we push something else to free up resources?

[14:06:25] **Priya (PM):** *sighs* Possibly. I'll talk to the product owner about delaying a lower-priority feature to Q4. For now, let's aim for 8 weeks, targeting early August for launch. Emma, can you make the UI simple enough for [redacted]'s non-technical users to set up without too much support?

[14:06:50] **Emma (UX):** Yup, that's the plan. I'm thinking clear labels, inline validation-like checking if the hostname's valid or the directory exists. Maybe a preview of a few files after connecting to show it's working. *pauses* Liam, did [redacted] mention any other requirements?

[14:07:08] **Liam (SA):** Uh, yeah, they want audit logs for the transfers. We can log when files are pulled, their sizes, and any authentication issues using our current system. I'll document that. Anything else, Priya?

[14:07:22] **Priya (PM):** Just that [redacted] wants a demo by mid-July-around July 15th. I know, it's tight. Emma, can you prepare a mock UI for that? Liam, can you fake an FTP connection for the demo?

[14:07:38] **Emma (UX):** *groans playfully* July 15th? Okay, I can get a clickable prototype by July 10th if we finalize the fields next week.

[14:07:46] **Liam (SA):** And I can set up a test SFTP server to simulate their setup. No real data, just enough to look good. *pauses* Priya, they okay with dummy data for the demo?

[14:07:55] **Priya (PM):** Yup, they're fine with it. Alright, let's call it. I'll schedule a follow-up for next week and update the project plan. Thanks, you two-great work!

****[14:08:10]** **Emma (UX):** Sweet, talk soon!**

****[14:08:12]** **Liam (SA):** Yup, later!**

****Call Ends at 14:08:15****
